

**TPC Group Plant Explosion and Fire Update  
Port Neches, Texas  
November 30, 2019 1500 Update**

**Incident Management Objectives:**

**Objective 1:** Ensure the health and safety of the public and response personnel.

**Objective 2:** Establish an incident management structure and processes employing the Incident Command System to enable effective overall management of the event with deployment of resources (staff and equipment) in a rapid, focused and well-coordinated manner.

**Objective 3:** Encourage a collaborative federalism approach, where Federal, State, Tribal, and local governments interact cooperatively and collectively to solve common problems.

**Objective 4:** Take actions to assess the on-site and off-site impacts during the emergency response phase of this incident. Provide this information to state and local authorities to assist them in their decision to protect the local citizens.

**Objective 5:** Conduct activities to prevent off-site releases from the TPC facility.

**Objective 6:** Respond to, mitigate and recovery off-site releases from the TPC facility.

**Objective 7:** Maintain open communication with Regional management.

**Incident Overview:**

On November 27, 2019, a report was received from the National Response Center about an explosion at a facility in Port Neches, TX.

A second explosion occurred at approximately 1400 on November 27, 2019. Residents within a four-mile radius of the site were ordered to evacuate. The evacuation was lifted at 1000 on November 29, 2019.

Unless there is a significant change in site condition, the next Management Update will be sent out at 1500 on December 1, 2019.

**Executive Overview:**

- Unified Command continues to run a 24-hour operational period: 0600 to 0600.
- As of today, 235 responders have checked-in since the incident began. The actual number responders on-site however, is probably higher as many field personnel from

different vendors likely have not been formerly checked in. Logistics has been requested to acquire a better number to track personnel.

- As of 1500 hours, 3 pressure fires continue to burn, and TPC will continue to provide suppression to the incident until the fires extinguish themselves. Smoke and particulate matter is greatly reduced compared to yesterday. The wind has primarily been out of the south for the duration of the day.
- As of November 30<sup>th</sup>, there has been no observed impact to the Neches River. TPC has taken measures to place large quantities of 18" hard and absorbent boom along the downstream path to the Neches River. At approximately 1050 hours, TPC observed the first dead fish at the Orchard Street Bridge. TCEQ notified Texas Parks and Wildlife of the deceased wildlife. EPA notified USFWS, as well.
- TPC provided a list and a diagram of facility tanks in the impact area and vicinity. This information provides impacted tanks to date, as well as the pre-incident volumes of each tank. Thirteen (13) tanks have been impacted from heat, smoke etc. Three (3) tanks have been compromised and have released contents.
- The current estimated rate of water use for fire suppression is approximately 31,000 gpm. Of that water use, 7,000 gpm is recycled water, leaving a net total of 24,000 gpm of freshwater use.
- The WWTP continues pumping firewater from the storage ponds into the WWTP. The current pumping rate is 6,900 gallons per minute (gpm).
- Unified Command has given permission for foam use if necessary, for vapor suppression that is fluorine free. The OSC received and is reviewing the Safety Data Sheets for each type of foam used and remaining on site. TPC plans to stage 6 totes of foam for vapor suppression tomorrow.
- Due to the sheen observed in the 201 Canal, the facility's Oil Spill Response Organization (OSRO) has placed absorbent boom every 50-100 feet along the canal. The sheen has not made it to the permitted containment discharge area. The furthest extent of the sheen was seen at the Port Neches/Atlantic Road approximately 2 miles from the outfall. It has not made it to the Neches River.
- EPA collected 3 water samples in the affected canal up to the Neches River and 1 water sample upstream of the incident, beginning November 30, 2019. Samples will be analyzed for VOCs, SVOCs, Oil and Grease, Glycols, Total Petroleum Hydrocarbons, and Total Organic Carbon. Samples will be delivered to ALS Laboratory in Houston for analysis on Monday morning, with the expectation of a 24-hour turnaround time on all analyses, except for SVOCs which has a 72-hour turnaround time.
- TCEQ and EPA air monitoring did not report any detections over public action levels for 1,3 butadiene, VOCs and particulates since the last update sent at 0700 hours.
- CTEH conducted 789 readings for 1,3 butadiene on November 30, 2019 – 10 detections were recorded with a maximum reading of 1.0 ppm. Unified Command was notified of these reading and additional air monitoring assets, including EPA, were dispatched to the area. The last reading was at 0650. EPA and TCEQ air monitoring teams were unable to confirm these readings.
- ASPECT conducted a fly-over of the site on the morning of November 30, 2019. No detections were recorded.
- A Story Map has been created for the incident and is public at the <https://response.epa.gov/south4groupfire> website.
